

MN Cohort 4 Positive Community Norms Community Survey 2022

--- Forest Lake ---

Descriptive Statistical Report

The results presented in this report are based on the 2022 Minnesota Cohort 4 Positive Community Norms Community Survey. This report was funded by MN DHS BHDH through the PCN grant.

Response Count:

Community	Initial Interview Responses	Oversample Interview Responses	Total Number of Responses	Margin of Error
Forest Lake	335	0	335	4.5%

Note: Initial Interview Responses is the number of responses needed per community for a representative Random Sample to be achieved. Oversample Interview Responses is the number of additional interviews conducted so that each community would have at least 100 randomly selected survey participants.

The Margin of Error is calculated based on the population of the focus area and the number of interviews conducted in the area. Because it is not possible to speak with everyone in the target area, a smaller number of interviews are conducted. The lower the Margin of Error, the more reliable your data is. An example would be if 60% of people interviewed responded “yes” to a question and our Margin of Error was 5%, we know that if the entire population of our target area were interviewed, our result of 60% would not deviate more than $\pm 5\%$, or 55% to 65%.

We used a 90% confidence level in this study. The confidence level indicates the probability that our sample of the focus area is also true for the population of that area. The confidence level means that if our survey was repeated 100 times, in 10 cases out of 100, the result of the survey would be correct for that set of respondents, but not representative of the entire surveyed group.
